

# Leaf and compound queries

# Leaf vs compound queries

- We have only covered leaf queries thus far
- Next up: compound queries
- Leaf queries search for values and are independent queries
  - E.g. the `term` and `match` queries
- Compound queries wrap *other* queries to produce a result

## Two leaf queries

```
GET /products/_search
{
  "query": {
    "term": {
      "tags.keyword": "Alcohol"
    }
  }
}
```

```
GET /products/_search
{
  "query": {
    "range": {
      "in_stock": {
        "lte": 5
      }
    }
  }
}
```

# One query per request

```
GET /products/_search
{
  "query": {
    [only a single query here]
  }
}
```

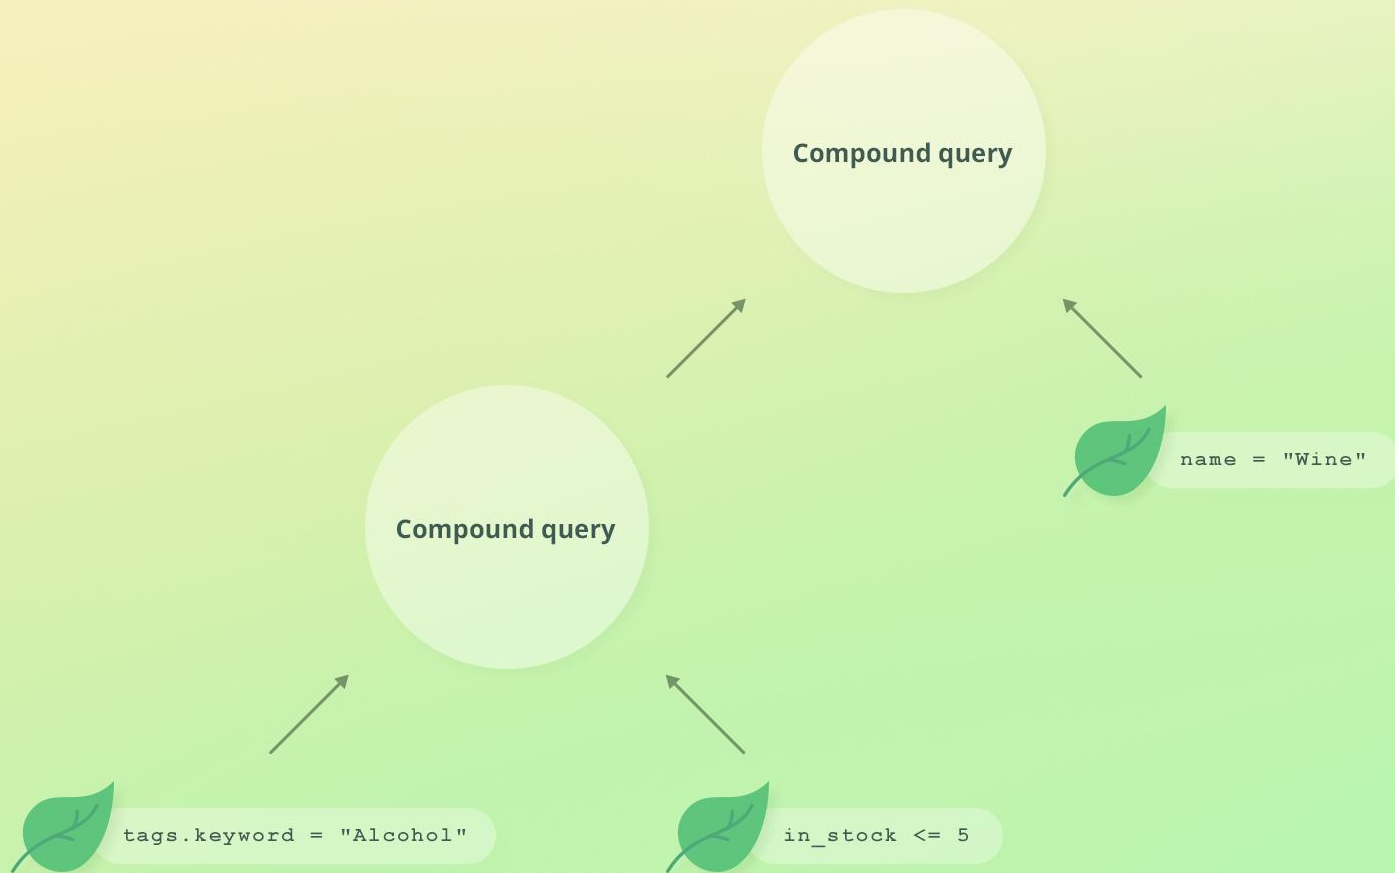

## Compound query

```
tags.keyword = "Alcohol"
```

```
in_stock <= 5
```

**SQL:** `WHERE tag = "Alcohol" AND (in_stock = 0 OR is_active IS FALSE)`
